THE PRODUCT DIRECTION

One growth goal. Agents keep the work moving.

A manager-facing concept for SalesPlay: the seller defines the outcome; the system investigates, prepares decisions, and changes its next action when customer facts change.

THE SELLER'S GOAL

"Find manufacturers where our core-stacking equipment could address an in-house assembly need."

Keep the user's outcome clear.

Jamie Shah at fictional Aster Automation sells machines that assemble laminated transformer cores in North America. Jamie needs a relevant account and a useful first conversation. Ridgeway and Evergreen are prospective accounts for that equipment. SalesPlay is the product helping Jamie investigate them.

The seller does	SalesPlay takes responsibility for
Set the goal and scope	Connect market context, specialist research, and account records. Investigate beyond the existing CRM list.
Review the recommendation	Show the evidence, its limits, the consequential unknown, and the appropriate next step.
Add a buyer fact	Change the account fit and research criteria, investigate another account, and flag old work for review.
Own the customer conversation	Prepare a short opening and specialist questions. Keep each action connected to its evidence version.

What makes the journey agentic.

The system carries a persistent goal across multiple research and decision steps. Feedback changes the investigation itself, not just the wording of an email. Specialist gaps become precise handoffs. Later account changes revise the next action. The interface keeps this work understandable through decisions, evidence, and visible activity.

Open: SalesPlay-Agentic-Manager-Demo.html. **Watch:** the recorded walkthrough. This PDF explains the scenario independently. The local prototype uses a deterministic scenario; it does not perform live autonomous research.

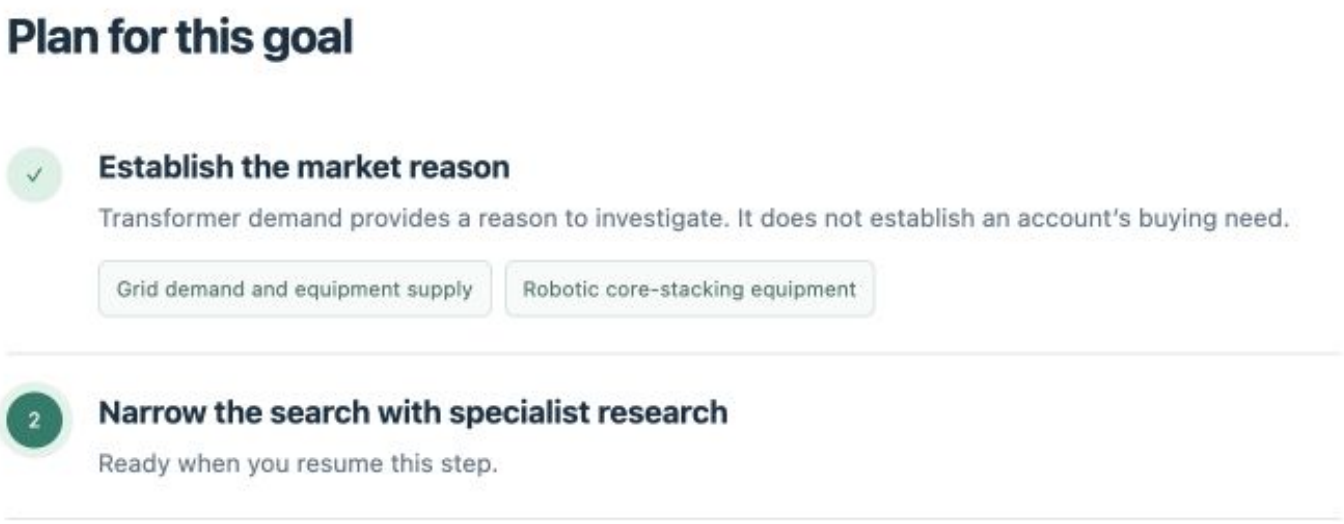

A quick path through the prototype

Start investigation. Review Ridgeway. Prepare, review, and save a conversation play. Reopen it and record outsourced assembly. Save the update. Review the new opportunity, prepare the analyst handoff, and apply the sample finding. Inspect Saved plays and Research activity to see the consequences.

SCENE 1 / GOAL TO INVESTIGATION

The goal starts a plan the seller can inspect.

Start the investigation from the prefilled goal. SalesPlay progresses through five observable actions; pause and resume let a manager inspect the sequence.

Recorded prototype detail: a completed context check links to its sources; the next specialist-research step is visible. These are scenario actions, not a hidden reasoning transcript.

Observable work	Output used by the next step
Establish the market reason	DOE industry context and the LAE equipment category. No account-level demand or buying intent inferred.
Narrow the process	A simulated segment map connects utility replacement applications to laminated-core production.
Inspect account evidence	Fictional profiles distinguish a new account, a known account, and an unsuitable wound-core process.
Check fit and uncertainty	Identify the provisional in-house assembly claim as the assumption that matters most.
Prepare the seller decision	An account to validate, supporting records, and the next buyer question.

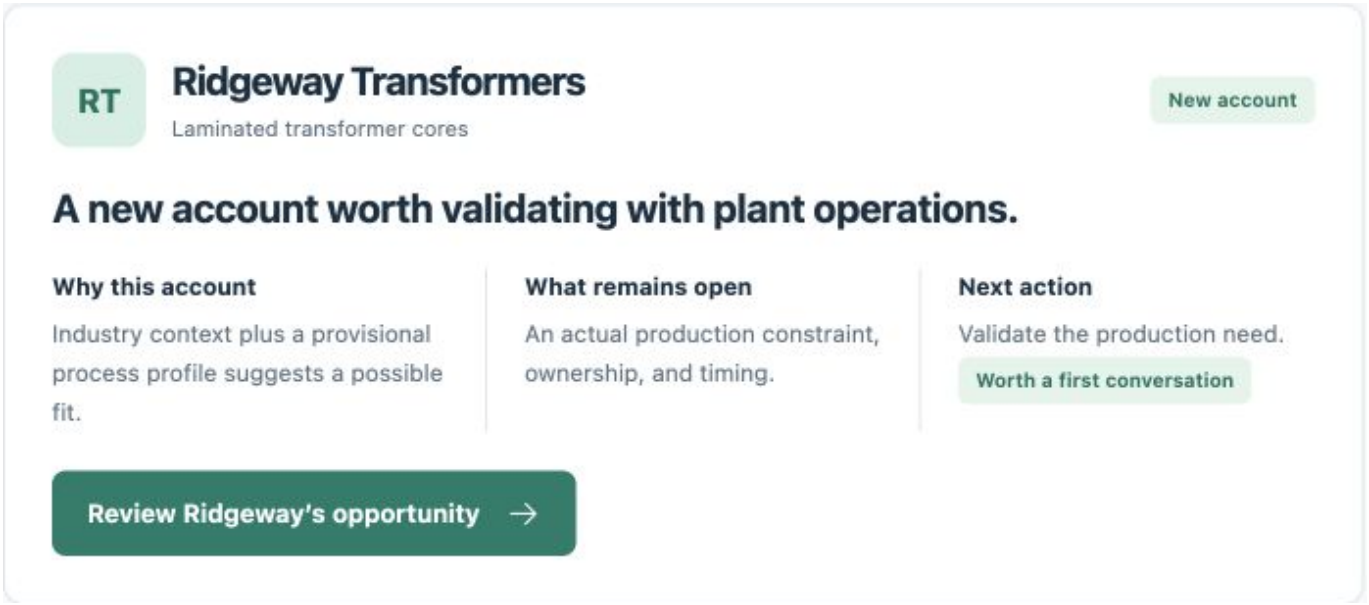

EVIDENCE TYPES STAY SEPARATE

Public sources establish context. Simulated specialist research illustrates the potential contribution of granular intelligence. Fictional account records suggest fit. A sample buyer fact can correct the account record.

SCENE 2 / RESEARCH TO ACTION

A new account, with a question worth asking.

Ridgeway is outside Jamie’s starting account list. Its process profile suggests an equipment fit, while the production need remains unconfirmed.

Recorded result: why Ridgeway surfaced, what remains open, and the next validation action are visible together.

Evidence or inference	Meaning for the seller
Industry context	Transformer demand provides a reason to investigate the sector. It does not establish Ridgeway’s order book.
Segment-to-process connection	The sample specialist map identifies relevant applications and an in-house laminated-core process.
Account profile	The starting record suggests that Ridgeway may perform that process. It can be wrong.
Next conversation	Ask the plant operations team whether assembly is in-house and whether it is slowing production.

The investigation produces something usable.

SalesPlay prepares a short opening and three questions. Jamie can edit the text; an edit clears the review. Saving records the current goal, research, and account-evidence version. A later change prevents the old play from being exported unchanged.

No contact name, email address, budget, capacity improvement, or financial return is invented. The scenario prepares work locally; it sends no message or CRM update.

SCENE 3 / ADAPTIVE INVESTIGATION

One buyer correction changes the next work.

The sample buyer says Ridgeway purchases finished cores from a supplier. The equipment approach no longer fits because Ridgeway does not perform the production step.

ADAPTIVE JOURNEY

A buyer fact changed the agent's next move.

Decision	Before	After
Ridgeway fit	Provisional in-house profile	Buyer says assembly is outsourced
Seller action	Explore an equipment conversation	Stop that equipment approach
Search criteria	Investigate a suggested process fit	Require explicit, recent in-house evidence
Next investigation	Ridgeway	Evergreen sample operations profile
Saved play	Reviewed against earlier facts	Needs review; export blocked

The account correction is specific to Ridgeway. The evidence requirement is a rule for this product goal. No general model training or global company claim is implied.

Inspect the activity log

Recorded comparison: the account fact, seller action, search criteria, next investigation, and saved-play validity change together.

THE AGENT'S RESPONSE

Retain the growth goal. Record the correction for Ridgeway. Require explicit, recent in-house assembly evidence for the next recommendation. Investigate Evergreen's sample operations profile and preserve the previous decision as history.

The buyer correction is account-specific. The evidence requirement is scoped to this product goal. This is maintained application context, not global company knowledge or model training. If the fixture pool has no further supported match, the prototype stops short of inventing one.

SCENE 4 / SPECIALIST JUDGMENT

Route each unknown to the right source.

Evergreen has explicit in-house process evidence. Product-segment relevance still needs a specialist check before progressing the opportunity in this scenario.

Prepared locally · not sent

Question for a specialist analyst

Does Evergreen's sample portfolio include laminated-core utility transformers within the segment map, and what qualification questions remain for the buyer?

Context already attached

The seller's goal, the revised in-house assembly condition, the operations profile, and the simulated segment map.

Evergreen: explicit assembly evidence

From utility replacement demand to core production

Recorded handoff detail: the question includes the goal, revised process condition, operations profile, and segment map. It is prepared locally; no analyst receives it.

Who can validate?	Question and resulting action
Analyst	Does the portfolio belong in the target segment? The simulated finding keeps Evergreen in scope.
Buyer	Is in-house assembly a production constraint, who owns it, and what is the timing? A separate sample response can confirm the need.
Application engineer	Once a need is confirmed, assess core designs, equipment compatibility, installation constraints, and costs.

THE GOAL CONTINUES AFTER THE FIRST PLAY

A later, manually played monitoring event says HarborGrid's expansion review is postponed. SalesPlay changes the timing question and invalidates affected drafts. There is no live watcher or scheduled job in this prototype.

RESEARCH ADVANTAGE AND FEASIBILITY

Make specialist intelligence improve the decision.

The proposed advantage is the quality of the account investigation: more useful connections, better-supported fit, and a next action that changes appropriately with evidence.

A competitive baseline already exists.

SalesPlay already markets agents for account monitoring, opportunity discovery, and sales execution. Kris@Work also positions research and execution as part of its GTM offering. Agent labels alone do not establish differentiation. These are vendor descriptions, not independently measured performance. [S3, S5]

MARKETSANDMARKETS' POTENTIAL CONTRIBUTION

KnowledgeStore describes analyst-curated research and market relationships. The product bet is to connect those relationships to product segments, manufacturing processes, account evidence, and the buyer's next decision. The segment findings in this demo are simulated; the research advantage remains unproven. [S4]

Feasible building block	Responsibility in a live product
Goal orchestrator	Maintain the seller's product, territory, objective, task state, and operating limits. Choose the next useful research or validation step.
Permissioned research tools	Retrieve public and entitled specialist records, preserve citations and dates, and surface missing or conflicting evidence.
Decision and version rules	Apply product-fit conditions, distinguish sources from inference, record current buyer facts, and invalidate old reviews.
Prepared work and handoffs	Produce evidence-linked opportunities, short conversation plays, and scoped analyst or technical tasks. Seller controls customer communication.

An achievable implementation sequence.

Begin with one orchestrator and a small tool set. Add entitled retrieval and citation checks, then analyst tasking and CRM context. Introduce monitoring only with an agreed scope and measured alert quality. Keep version rules, tool permissions, and evidence checks explicit in code.

Prototype boundary: local scenario objects, deterministic orchestration, browser persistence, and prepared artifacts work here. Live LLM research, licensed data access, integrations, analyst delivery, and recurring monitoring are future implementation work.

THE MANAGER'S NEXT DECISION

Test one goal with five accounts.

Propose one product line and territory, five named accounts, an evaluation owner, and a review date. A two-week evaluation is subject to research coverage, entitlement, and kickoff.

Test	Evidence to collect
Useful account choice	Would a seller act on the account or the new reason to revisit it? Separate useful novelty from a familiar signal.
Specificity and correctness	Can reviewers trace the product/process/account connection to applicable sources? Record factual errors and unsupported inferences.
Buyer-confirmed need	Does the account team or buyer validate a relevant need? Do not treat a market forecast as confirmation.
Adaptive behavior	Introduce a process correction. Does the agent change its search, retire the old action, and handle an empty result appropriately?
Research effort	Measure retrieval and analyst effort, elapsed time, operating cost, and repeatability alongside decision quality.

Isolate the contribution of specialist research.

Hold the account context, model, and workflow constant. Compare public-only research with public research plus entitled MarketsandMarkets intelligence. Use blinded review of useful novelty, specificity, correctness, and buyer-confirmed need. Five accounts provide directional pilot evidence, not a statistically proven revenue effect. No results are invented here.
