YOUR NEXT CUSTOMER CONVERSATION

Find the account. Understand the fit. Know the next move.

SalesPlay connects a sales goal to research, account evidence, and a conversation worth having.

The customer workspace starts with a clear goal, one product, and one market. The seller stays focused on the outcome.

THE EXAMPLE

Jamie Shah at Aster Automation sells robotic core-stacking equipment in North America. Jamie wants to find transformer manufacturers that could need more core-assembly capacity. All seller and account records in this example are fictional.

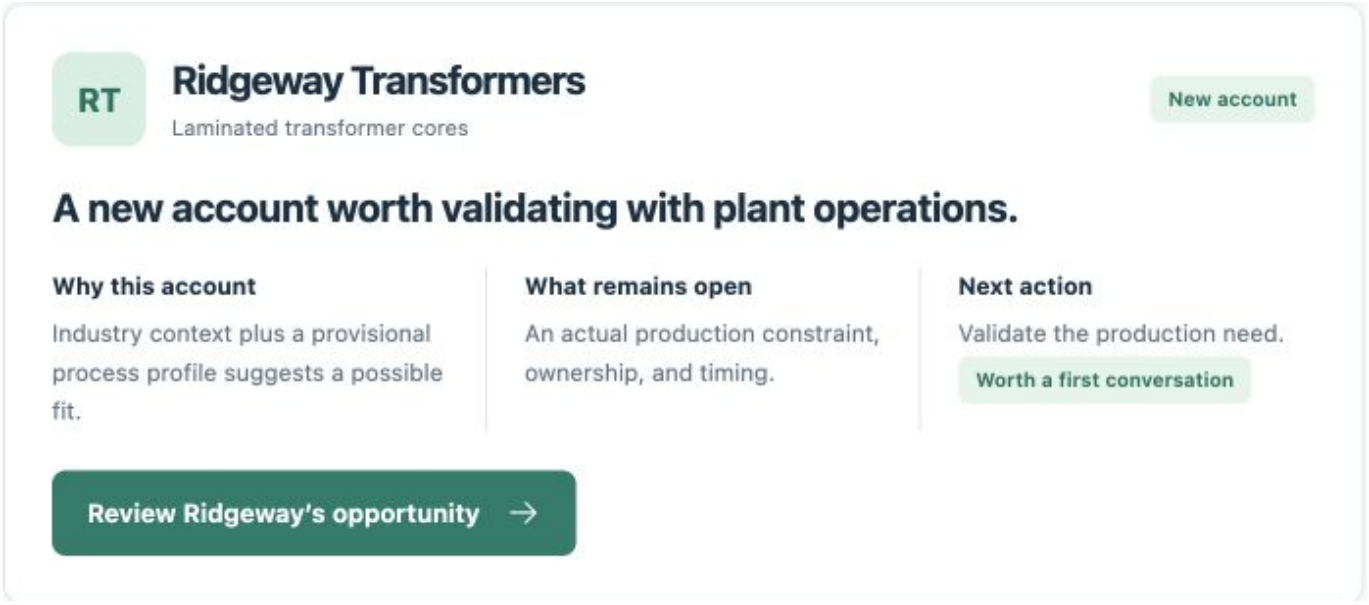

The journey: set a goal, let agents investigate, review a possible match, and adapt when the buyer shares new facts.

Open the interactive demonstration | Watch the four-minute walkthrough

RESEARCH TO A RELEVANT SHORTLIST

A demand signal becomes an account to investigate.

Agents work through market context, process fit, account evidence, and the next validation question. Each completed step links to the records it used.

Ridgeway surfaces outside Jamie's existing account list. The profile suggests a fit; the production need remains open.

Account	Why it matters	Next decision
Ridgeway Transformers	New account; provisional in-house process fit.	Ask the plant team to confirm how cores are assembled.
HarborGrid Manufacturing	Known account with an expansion review.	Clarify whether expansion includes core assembly.
Summit Wound Cores	The wound-core process does not fit this equipment.	Exclude it from this product search.

What specialist research could add

Broad grid demand gives Jamie a reason to look. Granular research can connect relevant transformer applications to the manufacturing process Jamie's product serves. Account evidence can then suggest where to investigate. The specialist map in this demonstration is simulated; its incremental value is a pilot hypothesis.

Public context: DOE: grid demand and equipment supply; LAE: robotic core-stacking category. Neither source establishes a fictional account's buying need. KnowledgeStore provides the public research-platform context.

EVIDENCE TO A USEFUL ACTION

Prepare a conversation. Leave the buying need open.

The seller gets an editable opening for the plant operations team and a focused set of discovery questions.

Your opening message

We help transformer manufacturers automate laminated-core assembly. Does Ridgeway assemble its cores in-house, and is that an area where you need more capacity? Would a short process discussion with your plant team be useful?

☑ I've reviewed this opening against the current account facts.

Save reviewed play → Export play

Jamie edits the opening, checks it against the current facts, and saves the play. This demonstration sends no outreach.

Question for the buyer	What it establishes
Do you assemble laminated cores in-house?	Whether the process matches the equipment.
Which production step needs more capacity?	The actual production need, rather than an inferred one.
Who owns the improvement, and what is the timing?	Ownership and a useful next step.

REVIEW STAYS CONNECTED TO THE FACTS

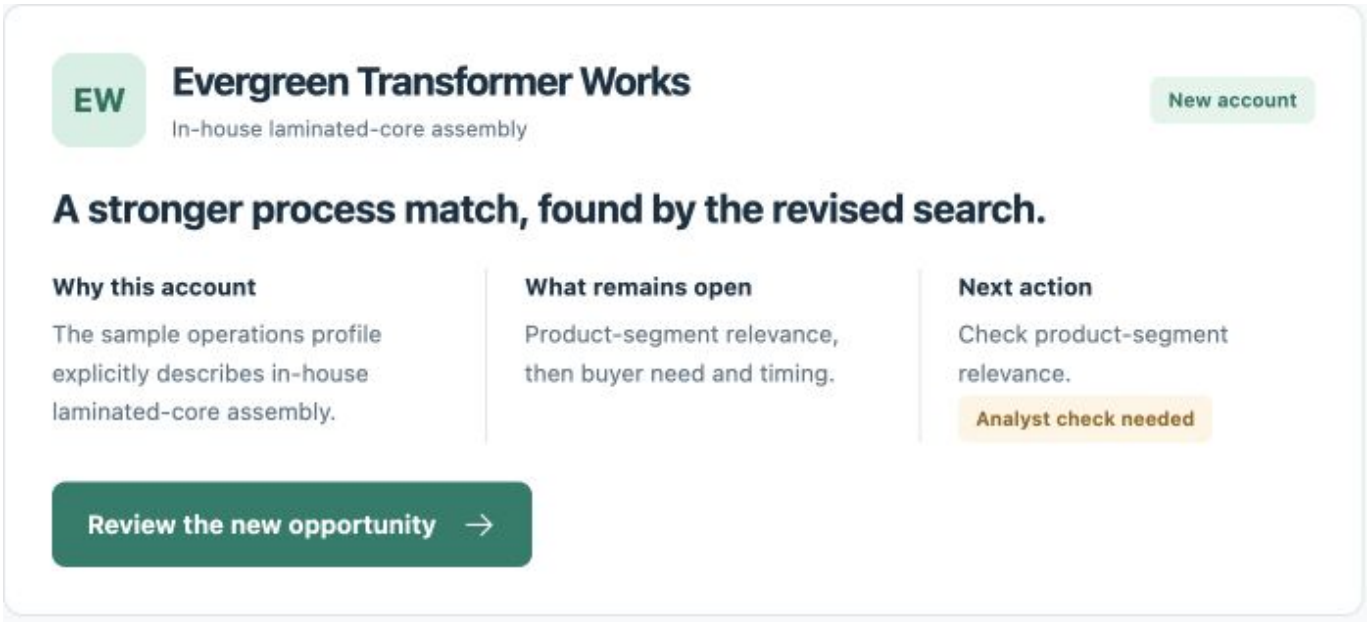

A saved message remains linked to the evidence behind it. New buyer or research information can require another review before that message can be used.

BUYER FEEDBACK CHANGES THE WORK

The goal continues. The next move changes.

The buyer says Ridgeway buys finished cores from a supplier. Its plant does not perform the work Jamie's equipment supports.

Decision	Before buyer feedback	After buyer feedback
Account fit	Provisional Ridgeway process match.	Ridgeway is excluded for this equipment.
Search requirement	A profile suggesting a process fit.	Explicit, recent evidence of in-house core assembly.
Next account	Investigate Ridgeway.	Investigate Evergreen against the stronger condition.
Saved play	Reviewed using the earlier facts.	Needs review; export is blocked.

Evergreen is newly investigated after the correction. A stronger process match still leaves a segment question for an analyst.

Validate with the right person

The analyst checks product-segment relevance. The buyer confirms the process and production need. When that need is confirmed in the sample, an application engineer becomes the next step for equipment compatibility and installation requirements. No automatic benefit or investment claim is made.

A FOCUSED PILOT

Try the journey on your own sales goal.

Start with one product, one market, and five accounts. Agree the desired outcome, research access, review owner, and review date.

Product

Robotic core-stacking equipment

Market

North America

Intended outcome

Find five relevant new accounts and validate the first buyer conversation.

Starting scope

Five accounts. Agree research access, a review owner, and a review date.

Export brief →

Edit brief

Saved in this browser. No pilot request has been submitted.

Plan a pilot prepares a local brief. No pilot request is submitted from this demonstration.

What to evaluate

Relevance and useful novelty: are the accounts a specific, useful addition?
Correctness and confirmed need: does the evidence hold up with the buyer?
Research effort: what work did the team need to reach the next conversation?

To test the research contribution, compare public research with public research plus appropriately entitled MarketsandMarkets intelligence under the same task. No research-performance, conversion, pipeline, or revenue results are claimed here.

About this demonstration. The account findings, agent actions, analyst findings, and buyer responses follow a controlled simulation. There is no live AI, licensed research, CRM, outreach, analyst service, or background monitoring connection. Editing the example goal does not run a live search.
